February 19, 1970

M E M O R A N D U M

February 19, 1970

TO: Malcolm D. Graham
Deputy Chief Engineer

FROM: Wm. P. Hofmann, Director
Bureau of Soil Mechanics

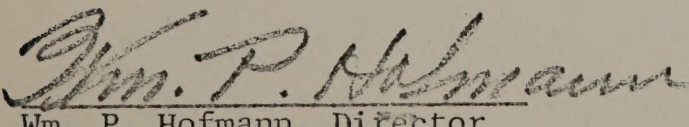

SUBJECT: Transmittal of Report
"Determination of Overlay Thickness"
PIN 7145.00
I-87 Ridge Road-Canadian Border
(Portion of Section C7.1-C9)
Clinton County

Transmitted herewith is the above report prepared at the request of Regional Director, Austin H. Emery, dated January 26, 1970.

The traffic analysis portion of the report was prepared by Keith Q. Smith of the Program Analysis Bureau. You will note that use of the "AASHO Interim Guide, Design of Flexible Pavement Structures" dated October 12, 1961 results in an empirical overlay thickness for this project of 1.02 inches. In my judgment, this thickness is neither practical nor adequate to provide a Serviceability Index of even 2.0 at the end of nine years.

I therefore recommend that the overlay consist of 2-1/2 inches of Item 51F, Asphalt Concrete - Type 1A (Mixing Method - Two Course) which is placed on Item 51TL, Asphalt Concrete, Truing and Leveling Course. A Special Note in the Proposal shall require that both courses are placed with a paver equipped with automatic controls.

It is my understanding that the Bureau of Public Roads has already approved the concept of an overlay for this section; but that the thickness of the overlay has yet to be justified. Consequently, the attached report should be transmitted to the Bureau of Public Roads as soon as possible. It is also my understanding that another condition survey of this section is not necessary.

Wm. P. Hofmann, Director
Bureau of Soil Mechanics

Inter - Office Correspondence

To: W. P. Hofmann, Director, Soils Mechanics Bureau Date: January 26, 1970
From: Austin H. Emery, Acting Regional Director, Region 7
By: Francis R. Campbell, Regional Design Engineer
Subject: Interstate System Pavement Evaluation

On page 17A of the "Current Road Program" for Region 7 is Project No. 7145.00, resurfacing Interstate 87, Route 502-5-4.2 Sect. 7D2, SH 58-25 in Clinton County.

In accordance with IM 21-1-67 and a letter to Reg. Transport Directors dated November 17, 1969 from J. K. Mladinov, we respectfully request a pavement design analysis on the above mentioned project.

Inasmuch as the proposed P.S.&E. date is February, 1970, your endeavor to justify this project will be greatly appreciated.

FRANCIS R. CAMPBELL
Regional Design Engineer

ANALYSIS OF PAVEMENT, DESIGN OF OVERLAY

(See 10C, 1/26/70 Emery to Hofmann)

A. KNOWN

1. Date of Authorization = 1958
2. FISH 58-25, Open to Traffic 1961
3. Length = 12.6 miles
4. Pavement Section (from plans):
 - 2 1/2 in. asph. conc. Item 51S, Type 1A
 - 3 in. " " Item 45SY
 - 4 in. broken stone Item 45
 - 12 in. subbase, Item 39A

B. ASSUMPTIONS

1. Pavement reached Serviceability Index = 2.5 in 1968.
2. ADL Travel Lane, 18^K Equip. Single Axle Loads, 1961 to 1968 (SI = 2.5) = 151.45 *
3. ADL 18^K ESAL, 1969 to 1978 = 230.25 *

* See computations by K. Q. Smith transmitted by 10C 2/10/70, Sternbach to Hofmann.

4. Coef. of Relative Strength (see page 22,
 - Item 51S, $q_1 = 0.44$
 - Item 45SY $q_2 = 0.34$
 - Item 45 $q_2 = 0.14$
 - Item 39A $q_3 = 0.11$
 AASHTO, Interim Guide 10/12/61)

5. Regional Factor, $R = 3$. (see page 20, ibid.)

Project No. 1-57

Location of Project

Date of Report

(Project No. 1-57)

Summary of Project Description or Objectives

1. General
This project was undertaken to determine the bearing capacity of a foundation for a structure. The foundation is located in a soft clay soil. The soil was tested using a plate load test. The results of the test are as follows:
2. Test Results
The test was conducted on a circular plate with a diameter of 12 inches. The load was applied in increments of 10,000 pounds. The settlement of the plate was measured at each load increment. The test results are shown in the following table:
3. Analysis
The test results were analyzed using the following equation:
$$q = \frac{P}{A}$$

where q is the bearing capacity, P is the load, and A is the area of the plate. The results of the analysis are shown in the following table:
4. Conclusion
The bearing capacity of the foundation is determined to be 10,000 pounds per square foot. This value is based on the results of the plate load test and the analysis of the test results.

5. Recommendations
It is recommended that the foundation be designed to support a load of 10,000 pounds per square foot. This recommendation is based on the results of the test and the analysis of the test results.

6. References
The following references were used in the preparation of this report:
1. Soil Mechanics, by C. E. Dyer, McGraw-Hill, 1959.
2. Foundation Engineering, by H. P.oulos, McGraw-Hill, 1961.
3. Soil Testing Methods, by T. W. Lambe, McGraw-Hill, 1957.

7. Appendix
The following data were obtained from the test results:
1. Test Results
The test was conducted on a circular plate with a diameter of 12 inches. The load was applied in increments of 10,000 pounds. The settlement of the plate was measured at each load increment. The test results are shown in the following table:
2. Analysis
The test results were analyzed using the following equation:
$$q = \frac{P}{A}$$

where q is the bearing capacity, P is the load, and A is the area of the plate. The results of the analysis are shown in the following table:

3. Conclusion
The bearing capacity of the foundation is determined to be 10,000 pounds per square foot. This value is based on the results of the test and the analysis of the test results.

8. Tables
The following tables were included in the report:
1. Table 1
This table shows the test results for the plate load test. The columns are labeled "Load (lb)" and "Settlement (in)". The data is as follows:
2. Table 2
This table shows the analysis of the test results. The columns are labeled "Load (lb)" and "Bearing Capacity (lb/sq ft)". The data is as follows:

I-87 (Portion of Section C7.1-C9)
Clinton County (Region 7)

Pavement Analysis

In summary our analysis furnishes

- 1) the equivalent 18,000# axle loads estimated to have occurred on one lane of the project pavement from the time of its opening to traffic in 1961 to the time the serviceability index had been reduced to 2.5 (assumed to be the year 1968). A structural number of 4.3 was used for this 8-year period. The ADL for this 8-year period is estimated to be 151.45.
- 2) the equivalent 18,000# axle loads estimated to occur from 1969 through the pavement design year of 1978. A structural number of 5.0 and a serviceability index of 2.0 was used for this period. The ADL for this 10-year period is estimated to be 230.25.

TRAFFIC DATA FOR
PAVEMENT JUSTIFICATION

I-87 2.6 Mile Portion of C7.1-C9

Pavement Design Year	1975	Data From
Pavement Authorization	1958	Table AW-2
Pavement Open to Traffic	1961	

With reference to BPR CM dated May 9, 1967:

The applicable design periods and design years for the pavement structure -

- (b) Projects constructed with FAI funds for which pavement construction was authorized prior to October 24, 1963: The design traffic analysis is to be 20 years after the date of authorization of the initial pavement construction project.

Therefore, the design year for pavement will be 1978.

Traffic data needed. (Refer to April 7, 1969 memo from G. M. Williams).

- a/ the total equivalent 18-kip single axle load applications that will have passed over the traffic lane of the pavement structure during the period of time from its initial opening to traffic (1961 in this case) to the date when the serviceability index (p_i) will be 2.5 and the overlay is to be placed.
- (b) the total equivalent 18-kip single axle load applications that will have passed over the traffic lane of the pavement structure during the period of time from its initial opening to traffic (1961 in this case) to the time that the pavement on which an overlay has been placed will have a serviceability index (p_i) of 2.0, which traffic and time period are represented in design at least by a 20-year design period.

Refer to pages A53 to A66 of the 1970 Interstate Cost Estimate Manual.

Data from Table W-1 for Station #782 for Selected Years

Vehicle Type	1964	% Tot.	1965	% Tot.	1966	% Tot.	1968	% Tot.
Pass. Cars	7602	94.18	3916	87.96	4166	85.25	4173	85.16
Buses	16	0.20	23	0.52	44	0.90	53	1.08

2-axle, 6-tire trucks	72	0.89	87	1.95	160	3.28	126	2.57
3-axle trucks	5	0.06	13	0.29	23	0.47	13	0.27
3-axle semi-trailers	25	0.31	37	0.83	28	0.57	27	0.55
4- " "	201	2.49	188	4.22	144	2.95	144	2.94
5- " "	30	0.37	90	2.02	159	3.25	228	4.65
4-axle full trailers	1	0.01	1	0.02	0	0	2	0.04
Tot. Vehs. Counted	8072	100.00	4452	100.00	4887	100.00	4900	100.00

Note: 1964 count made on Canadian National Holiday.
1967 count not included - because of Expo 67.

Conclusion:

Use year 1968 as the representative year to determine percent of trucks.

LANE DISTRIBUTION: Refer to page 106 - Highway Capacity Manual
 "On Upgrades . . . most of the trucks stay in
 lane 1,"

Assumption: 95% of the lighter trucks use
 Lane 1. 100% of the heavier trucks use Lane 1.
 Since passenger cars have little effect on
 Pavement Design assume 60% in Lane 2, 40% in
 Lane 1.

Received call from W. Hofmann and he furnished the following data:

1. He would like us to estimate the equivalent 18,000# axle loads that have been over the pavement from 1961 (date of initial service) through 1968 (date of physical inspection and assumed P of 2.5) SN is 4.3 for this period.
2. Calculate the equivalent 18,000# axle loads that will go over the pavement from 1969 through 1978 (design year). Assume P of 2.0 and SN of 5 for this 10-year period.
